

Instructions

Create a 411 (114 in Israel) website that allows you to search phone numbers of people by their names or names of people.

The database should have a table **Person** with the following attributes:

```
id (Integer, Primary Key)
name (String)
email (String, unique)
phone number (PhoneNumberField)
address (String)
```

The phone number should be represented using a PhoneNumberField which is provided by the django-phonenumbers-field package.

1. Create a view /persons/phonenumbers that will display all the info of a person depending on his phone number
2. Create a view /persons/name that will display all the info of a person depending on his name.
 - If there is no result either way, inform the user on the page.
